Question 1 Write a program that prints a simple chessboard. Correct Marked out of 3.00 Input format: Flag question The first line contains the number of inputs T. The lines after that contain a different values for size of the chessboard Output format: Print a chessboard of dimensions size \* size. Print a Print W for white spaces and B for black spaces. Input: 2 3 5 Output: WBW **BWB** WBW **WBWBW BWBWB** 

**WBWBW** 

**BWBWB** 

**WBWBW** 

```
#include<stdio.h>
 2 int main()
 3 +
 4
        int n;
        scanf("%d",&n);
 5
 6 ₹
        for(int i=0;i<n;i++){
            int a;
 7
            char c1='B',c2='W';
 8
            scanf("%d",&a);
 9
            for(int j=0;j<a;j++){</pre>
10 ,
11 -
                if(j%2!=0){
                    c1='W',c2='B';
12
13
                else{
14 *
15
                    c1='B',c2='W';
16
17 +
                for(int k=0;k<a;k++){
                    if(k%2!=0){
18 +
                        printf("%c",c1);
19
20
21 •
                    else{
                        printf("%c",c2);
22
23
24
25
                printf("\n");
26
27
28
        return 0;
29
30
```

Question 2

Correct

Marked out of 5.00

Flag question

Let's print a chessboard!

Write a program that takes input:

The first line contains T, the number of test cases

Each test case contains an integer N and also the starting character of the chessboard

**Output Format** 

Print the chessboard as per the given examples

Sample Input / Output

Input:

```
2
2 W
3 B
Output:
WB
BW
BWB
WBWB
```

```
#include<stdio.h>
 2 void cb(int n, char c1){
        char c2=(c1=='W')?'B':'W';
 3
        for(int i=0;i<n;i++){
 4 +
            for(int j=0;j<n;j++){
 5 .
               printf("%c",((i+j)%2==0)?c1:c2);
 7
 8
            printf("\n");
 9
10
11
12
13
14
    int main()
15 + {
        int n,t;
16
17
        char c1;
        scanf("%d",&t);
18
19 +
        while(t--){
            scanf("%d %c" &n &c1).
```

```
15 , {
16
        int n,t;
17
        char c1;
        scanf("%d",&t);
18
19
        while(t--){
           scanf("%d %c",&n,&c1);
20
           cb(n,c1);
21
22
23
        return 0;
24 }
```

	Input	Expected	Got	
~	2	WB	WB	~
	2 W	BW	BW	
	3 B	BWB	BWB	
		WBW	WBW	
		BWB	BWB	

Passed all tests! <

Question **3** 

Correct

Marked out of 7.00

Flag question

Decode the logic and print the Pattern that corresponds to given input.

If N= 3

then pattern will be:

10203010011012

\*\*4050809

\*\*\*\*607 If N= 4, then pattern will be: 1020304017018019020 \*\*50607014015016 \*\*\*\*809012013 \*\*\*\*\*10011 Constraints

2 <= N <= 100

Input Format

First line contains T, the number of test cases Each test case contains a single integer N

Output

First line print Case #i where i is the test case number In the subsequent line, print the pattern

Test Case 1

```
5
Output
Case #1
10203010011012
**4050809
****607
Case #2
1020304017018019020

Question 1 Correct	The k-digit number N is an Armstrong number if and only if the k-th power of each digit sums to N.					
Marked out of 3.00	Given a positive integer N, return true if and only if it is an Armstrong number.					
	Example 1:					
	Input:					
	153					
	Output:					
	true					
	Explanation:					
	153 is a 3-digit number, and 153 = 1^3 + 5^3 + 3^3.					
	Example 2:					
	Input:					
	123					

Output.
false
Explanation:
123 is a 3-digit number, and 123 != 1^3 + 2^3 + 3^3 = 36.
Example 3:
Input:
1634
Output:
true
Note:
1 <= N <= 10^8
Answer: (penalty regime: 0 %)

```
#include<stdio.h>
    int main()
 2
 3 +
        int n,temp,r,i,p,c=0,sum=0;
 4
        scanf("%d",&n);
 5
 6
        temp=n;
        while(temp>0)
 8 .
            c=c+1;
 9
            temp=temp/10;
10
11
12
        temp=n;
        while(n>0)
13
14 +
            r=n%10;
15
16
            i=1;
17
            p=1;
            while(i<=c){
18 +
19
                p=p*r;
20
                ++i;
21
22
            sum=sum+p;
23
            n=n/10;
24
25
        if(sum==temp)
        printf("true");
26
27
        else
        printf("false");

Question 3 A number is considered lucky if it contains either 3 or 4 or 3 and 4 both in it. Write a program to print the nth lucky number. Example, 1st lucky number is 3, and Correct 2nd lucky number is 4 and 3rd lucky number is 33 and 4th lucky number is 34 and so on. Note that 13, 40 etc., are not lucky as they have other numbers in it. Marked out of 7.00 The program should accept a number 'n' as input and display the nth lucky number as output. Flag question Sample Input 1: 3 Sample Output 1: 33 Explanation: Here the lucky numbers are 3, 4, 33, 34., and the 3rd lucky number is 33. Sample Input 2: 34 Sample Output 2:

```
Answer: (penalty regime: 0 %)
```

```
1 #include<stdio.h>
    int main()
 3 ,
        int n=1,i=0,nt,c=0,e;
 4
        scanf("%d",&e);
 5
        while(i<e)
 6
 7 *
 8
            nt=n;
            while(nt!=0){
 9 ,
10
                c=0;
11
                if(nt%10!=3&&nt%10!=4)
12 +
13
                    c=1;
14
                    break;
15
16
                nt=nt/10;
17
18
            if(c==0)
19 +
                i++;
20
21
22
            n++;
23
        printf("%d",--n);
24
25 }
```
